

## HOW DO PEDESTRIAN PUSH BUTTONS WORK?

All Pedestrian Push Buttons, when depressed just once, will put a call into the Traffic Control Device. The intersection will complete the current cycle that it is in before it will acknowledge the Pedestrian's request. This will sometimes take a couple of minutes depending on how heavy the traffic flows are at the time of activation. When traffic has lightened or cleared out and the video detectors or conventional loops do not detect any more vehicles, the controller will then serve the pedestrian's call activated by the push button. **Hitting, kicking or pushing the buttons several hundred times will not get your pedestrian call served any faster.**
